

GreenJacket

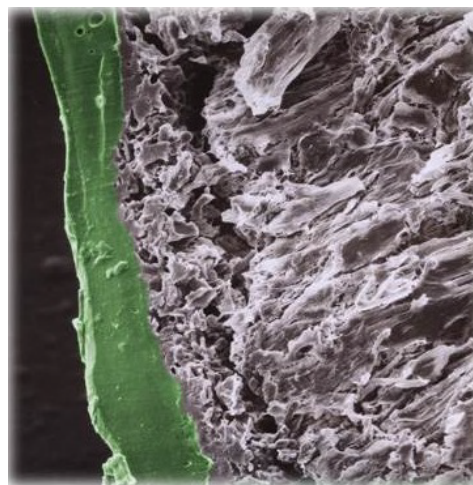

Controlled Release Fertiliser

- ✔ State of the art polymer coating technology
- ✔ Security against premature release
- ✔ Scientifically designed nutritional formulation
- ✔ Available in a variety of stable longevities

Green Jacket controlled release fertiliser utilises an ultra-thin advanced polyurethane coating that is unlike any other controlled release product on the market today. The release of the product is only affected by temperature and coating density. Green Jacket contains only the highest quality nutritional inputs to provide your crop with the nutrition it needs, when it needs it.

Green Jacket releases through diffusion, or more simply put, a process that allows a constant, gradual movement of nutrients through the polyurethane coating into the growing media. As water goes in, the nutrients are released allowing each prill to dependably and reliably deliver nutrition to the root zone for controlled feeding with just one application.

Green Jacket is different from other products on the market due to its coating quality and the quality assurance that goes into every batch of fertiliser produced. Green Jacket goes through a series of quality control tests to ensure that each batch releases the exact same way every time. No other controlled release fertiliser can offer the proven durability, reliability and predictable performance that Green Jacket offers. As a result, growers get the performance they have come to trust - each and every time.
